

# Reflex Sports

## A Perfect Balance of Aesthetics and Performance

---

Constant running, jumping, twisting and turning can place a great strain on athletes' ankles, knees and hip joints. Underneath each Reflex playing surface there are highly engineered sub floor systems purpose designed to reduce stress, strain and muscle fatigue. Our mission is to design and install performance floors that not only enhance the sport but provide maximum comfort and safety for each participant. We aim to protect the athlete and also the protecting the integrity of our environment.

At Reflex Sports we:

Create surfaces with long and durable life cycles that can be easily maintained. By creating durable systems this ultimately equates to lower quantities of materials being used, less manufacturing, less energy and resources used in the recycling process and reduced material in landfill at the end of the product lifespan.

Optimize facility usage by creating surfaces that provide versatility and structural integrity for multiple uses. For example our Reflex Portable system can transform an exhibition centre into a venue suitable for professional sport in a matter of hours

Promote the use of sustainable forestry by offering timbers with FSC® or PEFC certification in line with our strict environmental policy. Other components used within our products should be from renewable natural resources.

Provide environmentally friendly synthetic sports surfaces. Our Reflex polyurethane floors feature the latest water based non-toxic top coat technology and our timber sports surfaces require no additional lacquers applied on site.

Install our own flooring systems safely working with our clients to achieve customer satisfaction. By controlling the design and installation process we can offer guaranteed technical competence and surfaces to the highest industry standards.
